

What is claimed is:

1. An image processing method for executing image processing of image data, said method comprising:

5 acquiring shooting information that indicates shooting conditions at the time of shooting, said information describing a plurality of shooting condition parameters;

10 acquiring image processing control information that designates a plurality of picture quality adjustment parameters to be used during image processing, said information describing a plurality of specifying parameters;

15 setting said plurality of picture quality adjustment parameters on the basis of said plurality of specifying parameters, while for any of said plurality of picture quality adjustment parameters that is not set by means of said specifying parameters, setting these said picture quality adjustment parameters on the basis of said shooting condition parameters; and

executing image processing of said image data using said set picture quality adjustment parameters.

20 2. An image processing method according to Claim 1 wherein said plurality of specifying parameters include parameters that make up particular combinations of specifying parameters appropriate to particular shooting scenes, for designating image processing depending on the shooting scene;

25 and wherein said shooting condition parameters include scene-specific shooting condition parameters describing a particular shooting scene set at the time of shooting.

30 3. An image processing method according to Claim 1 or 2 wherein image processing of said image data comprises:

analyzing said image data to extract characteristic parameters that indicate picture quality characteristics of image data;

- acquiring a plurality of standard parameters predetermined for said plurality of picture quality adjustment parameters and serving as targets in picture quality adjustment; and
- adjusting picture quality of said image data by eliminating or
- 5 reducing any deviation between each value of said characteristic parameters and each value of said acquired standard picture quality parameters with reflecting said plurality of picture quality adjustment parameters.
- 10 4. An image processing method for executing image processing of image data that has been associated with at least one set of information selected from shooting information indicating shooting conditions at the time of shooting, and image processing control information designating a plurality of picture quality adjustment parameters to be used during image
- 15 processing, said method comprising:
- acquiring said image data;
- searching, from among the image processing conditions associated with said image data, for a scene-specific shooting condition parameter depending on a particular shooting scene;
- 20 in the event that a said scene-specific shooting condition parameter is not found, searching, from among the shooting conditions associated with said image data, for a shooting scene condition;
- searching, from among the image processing conditions associated with said image data, for an arbitrary image processing designating
- 25 condition that arbitrarily designates an image processing condition;
- in the event that a said arbitrary image processing designating condition is not found, searching, from among the shooting conditions associated with said image data, for an arbitrarily set shooting condition; and
- 30 acquiring each said searched for condition, and executing image processing of said image data using said acquired conditions.

5. An image processing method according to Claim 4 wherein
image processing of said image data comprises:
 - analyzing said image data to extract characteristic parameters that indicate picture quality characteristics of image data;
 - 5 acquiring a plurality of standard parameters serving as targets in picture quality adjustment; and
 - adjusting picture quality of said image data by eliminating or reducing any deviation between each value of said characteristic parameters and each value of said acquired standard picture quality parameters with reflecting said plurality acquired.
- 10
6. An image processing method for executing image processing of image data that has been associated with at least one set of information selected from shooting information that indicates shooting conditions at the time of shooting, and image processing control information that designates a plurality of picture quality adjustment parameters to be used during image processing, said method comprising:
 - acquiring shooting scene information from said shooting conditions;
 - defining scene correction information on the basis of said acquired
 - 20 shooting scene information;
 - searching among said image processing conditions for a scene-specific image processing condition that designates an image processing condition on a scene-specific basis;
 - in the event that said scene-specific image processing condition is found among said image processing conditions, replacing said scene correction information with said scene-specific image processing condition;
 - 25 acquiring arbitrary correction information from said shooting conditions;
 - defining image arbitrary correction information on the basis of the acquired said arbitrary correction information;
 - 30 searching among said image processing conditions for an arbitrary image processing condition designating an arbitrarily selected image

processing condition;

in the event that a said arbitrary image processing condition is found among said image processing conditions, replacing said image arbitrary correction information with said arbitrary image processing condition; and

5 executing image processing of said image data on the basis of said scene correction condition and said image arbitrary correction information.

7. An image processing method according to Claim 6 wherein image processing of said image data comprises:

10 analyzing said image data to extract characteristic parameters that indicate picture quality characteristics of image data;

acquiring a plurality of standard parameters serving as targets in picture quality adjustment; and

15 adjusting picture quality of said image data by eliminating or reducing any deviation between each value of said characteristic parameters and each value of said acquired standard picture quality parameters with reflecting said scene correction condition and said image arbitrary correction information.

20 8. An image processing method for executing image processing of image data that has been associated with at least one set of information selected from shooting information that indicates shooting conditions at the time of shooting, and image processing control information that designates a plurality of picture quality adjustment parameters to be used during

25 image processing, said method comprising:

selecting either said shooting information or said image processing control information;

acquiring as information either said selected shooting information or said image processing control information; and

30 executing picture quality adjustment processing of said image data using said acquired information.

9. An image processing apparatus for executing image processing of image data, said apparatus comprising:

shooting information acquisition logic for acquiring shooting information that indicates shooting conditions at the time of shooting, said
5 information describing a plurality of shooting condition parameters;

image processing control information acquisition logic for acquiring image processing control information that designates a plurality of picture quality adjustment parameters to be used during image processing, said information describing a plurality of specifying parameters;

10 picture quality adjustment parameter setting logic for setting said plurality of picture quality adjustment parameters on the basis of said plurality of specifying parameters, while for any of said plurality of picture quality adjustment parameters that is not set by means of said specifying parameters, setting these said picture quality adjustment parameters on
15 the basis of said shooting condition parameters; and

image processing logic for executing image processing of said image data using said set picture quality adjustment parameters.

10. An image processing apparatus for executing image processing of image data that has been associated with at least one set of information selected from shooting information indicating shooting conditions at the time of shooting, and image processing control information designating a plurality of picture quality adjustment parameters to be used during image processing, said apparatus comprising:

25 image data acquisition logic for acquiring said image data;
first search logic for searching, from among the image processing conditions associated with said image data, for a scene-specific shooting condition parameter depending on a particular shooting scene, and in the event that a said scene-specific shooting condition parameter is not found,
30 searching, from among the shooting conditions associated with said image data, for a shooting scene condition;

second search logic for searching, from among the image

processing conditions associated with said image data, for an arbitrary image processing designating condition that arbitrarily designates an image processing condition, and in the event that a said arbitrary image processing designating condition is not found, searching, from among the 5 shooting conditions associated with said image data, for an arbitrarily set shooting condition; and

image processing logic for executing image processing of said image data using conditions acquired by each said search logic.

10 11. An image processing apparatus for executing image processing of image data that has been associated with at least one set of information selected from shooting information that indicates shooting conditions at the time of shooting, and image processing control information that designates a plurality of picture quality adjustment 15 parameters to be used during image processing, said apparatus comprising:

scene information acquisition logic for acquiring shooting scene information from said shooting conditions, and defining scene correction information;

20 first search logic for searching among said image processing conditions for a scene-specific image processing condition that designates an image processing condition on a scene-specific basis;

25 scene correction information update logic that, in the event that a said scene-specific image processing condition is found among said image processing conditions, replaces said scene correction information with said scene-specific image processing condition;

arbitrary correction information acquisition logic for acquiring arbitrary correction information from said shooting conditions, and defining image arbitrary correction information;

30 second search logic for searching among said image processing conditions for an arbitrary image processing condition designating an arbitrarily selected image processing condition;

- image arbitrary correction information update logic that, in the event that a said arbitrary image processing condition is found among said image processing conditions, replaces said image arbitrary correction information with said arbitrary image processing condition; and
- 5 picture quality adjustment logic for executing image processing of said image data on the basis of said scene correction condition and said image arbitrary correction information.

12. An image processing apparatus for executing image processing of image data that has been associated with at least one set of information selected from shooting information that indicates shooting conditions at the time of shooting, and image processing control information that designates a plurality of picture quality adjustment parameters to be used during image processing, said apparatus
- 10 comprising:
- selection logic for selecting either said shooting information or said image processing control information;
- information acquisition logic for acquiring as information either said selected shooting information or said image processing control information;
- 15 and
- image processing logic for executing picture quality adjustment processing of said image data using said acquired information.

13. A computer program product having stored thereon image processing program instructions for executing image processing of image data, said computer program product comprising:
- a program instruction for acquiring shooting information that indicates shooting conditions at the time of shooting, said information describing a plurality of shooting condition parameters;
- 20 a program instruction for acquiring image processing control information that designates a plurality of picture quality adjustment parameters to be used during image processing, said information

describing a plurality of specifying parameters;

a program instruction for setting said plurality of picture quality adjustment parameters on the basis of said plurality of specifying parameters, while for any of said plurality of picture quality adjustment parameters that is not set by means of said specifying parameters, setting these said picture quality adjustment parameters on the basis of said shooting condition parameters; and

a program instruction for executing image processing of said image data using said set picture quality adjustment parameters.

10

14. A computer program product having stored thereon image processing program instructions for executing image processing of image data that has been associated with at least one set of information selected from shooting information that indicates shooting conditions at the time of shooting, and image processing control information that designates a plurality of picture quality adjustment parameters to be used during image processing, said computer program product comprising:

a program instruction for acquiring said image data;

a program instruction for searching, from among the image

20 processing conditions associated with said image data, for a scene-specific shooting condition parameter depending on a particular shooting scene;

a program instruction that, in the event that a said scene-specific shooting condition parameter is not found, searches, from among the shooting conditions associated with said image data, for a shooting scene

25 condition;

a program instruction for searching, from among the image processing conditions associated with said image data, for an arbitrary image processing designating condition that arbitrarily designates an image processing condition;

30 a program instruction that, in the event that a said arbitrary image processing designating condition is not found, searches, from among the shooting conditions associated with said image data, for an arbitrarily set

shooting condition; and

a program instruction for acquiring each said searched for condition, and executing image processing of said image data using said acquired conditions.

5

15. A computer program product having stored thereon image processing program instructions for executing image processing of image data that has been associated with at least one set of information selected from shooting information that indicates shooting conditions at the time of 10 shooting, and image processing control information that designates a plurality of picture quality adjustment parameters to be used during image processing, said computer program product comprising:

a program instruction for acquiring shooting scene information from said shooting conditions;

15 a program instruction for defining scene correction information on the basis of said acquired shooting scene information;

a program instruction for searching among said image processing conditions for a scene-specific image processing condition that designates an image processing condition on a scene-specific basis;

20 a program instruction that, in the event that said scene-specific image processing condition is found among said image processing conditions, replaces said scene correction information with said scene-specific image processing condition;

a program instruction for acquiring arbitrary correction information 25 from said shooting conditions;

a program instruction for defining image arbitrary correction information on the basis of the acquired said arbitrary correction information;

30 a program instruction for searching among said image processing conditions for an arbitrary image processing condition designating an arbitrarily selected image processing condition;

a program instruction that, in the event that a said arbitrary image

processing condition is found among said image processing conditions, replaces said image arbitrary correction information with said arbitrary image processing condition; and

a program instruction for executing image processing of said image

- 5 data on the basis of said scene correction condition and said image arbitrary correction information.
